Full-Stack Engineer with 5+ years building complex web systems; whatever the domain demands. I move comfortably across the stack: architecting NestJS backends, shipping production Next.js frontends, and integrating real-time infrastructure. I care about systems that are correct, scalable, and maintainable; not just working.

EXPERIENCE

Frontend Engineer · Marimax Global Concepts Limited / *Sept 2025 – June 2026*

- Architected a multi-tenant Next.js system with sub-role switching, scoping API data dynamically per selected role context
- Built a real-time delivery dispatch system with in-app and push notifications, cutting user feedback latency significantly
- Implemented permission-based rendering patterns, eliminating raw role conditionals across the UI layer

Fullstack Engineer · Prime Church / *March 2026 – Present*

- Designed and architected a multi-tenant, multi-organisation NestJS backend supporting users belonging to multiple organisations simultaneously
- Built an organisation-switching API endpoint with session-aware context propagation
- Implemented multi-role access control with admin-level overview and configuration surfaces

Backend Engineer · Builders Who Ship / *Jan 2026*

- Normalised open-ended user input using an LLM pipeline, sanitising and structuring unstructured data before system ingestion
- Contributed to a collaborative hackathon build, shipping a working product within a constrained timeline

Backend Engineer · Cavista Hackathon 2026 / *2026 · Hackathon*

- Built the backend for DriftCare, an AI-powered daily health check-in platform that tracks how far users are drifting from their personal health baseline

- Designed a drift score engine (0–100%) that starts at 100% for new users and adjusts over time as daily check-in responses are logged; dropping when health indicators default, holding when habits are maintained
- System surfaces exactly which habits are defaulting so users can course-correct before conditions escalate to critical health situations

Frontend Engineer • Cavista Hackathon 2025 / 2025 · Hackathon

- Built the frontend for a pharmacist management platform where pharmacists create prescriptions for patients (drug name, category, dosage schedule) and patients automatically receive WhatsApp dosage reminders
- Implemented a dashboard showing patient count, prescriptions administered, and prescription default count; patients list with drill-down to individual patient and per-prescription detail pages
- Mapped dosage schedule codes (1-1-0, 1-0-1, etc.) to human-readable strings for a friendlier prescription creation experience

Fullstack Engineer • Roware / Oct 2020 – Dec 2022

- Built static websites for clients including an MFM branch and Seplat, delivering polished, cross-browser compatible interfaces
- Developed dynamic web applications using Node.js with EJS templating, owning both backend routing and server-side rendered views
- Gained foundational experience in full-stack delivery: handling server logic, data flow, and frontend rendering before adopting React

EDUCATION

BSc. Electrical & Electronics Engineering • University of Lagos / Dec 2019 – Feb 2027 (Expected)

- Specialisation in circuit behaviour, hardware prototyping, and control systems
- Final Year Project: ESP32-based smart distribution board with CT clamp sensing, relay automation, and a real-time web dashboard

PROJECTS

Seamless Point — Logistics, Utility Payments & On-Demand Services

- Built an all-in-one platform unifying courier/package delivery, utility bill payments (cable, electricity, data, airtime), and on-demand technician booking
- Architected a decoupled Next.js frontend communicating with an external backend API via Server Actions, with TanStack Query for server state and Zustand for UI state

- Integrated Paystack with a custom kobo-math fee computation module for accurate local and international charge previews before transaction

FaithCare — Church Management Platform

- Dual-persona SPA with JWT auth, React Query, and real-time member tracking; role-based access for admin and member views

Busly — Lagos Bus Navigation App

- Stop-by-stop transit navigation for informal urban networks; OSM data via Overpass API with PostGIS spatial seeding

SKILLS

Languages & Frameworks: TypeScript, JavaScript, Node.js, React, Next.js 15, NestJS, Express.js, EJS

Architecture & Patterns: Multi-tenancy, RBAC, JWT auth (silent refresh, httpOnly cookies), SSE, Webhooks, REST, Microservices

Databases & ORMs: PostgreSQL, MongoDB Atlas, Prisma, Mongoose, PostGIS

Tools & Platforms: Git/GitHub, Docker, Vercel, Figma, Paystack

AI & Emerging: LLM integration (OpenRouter), AI agent workflows, MCP servers, Prompt engineering

AWARDS

Cavista Hackathon 2025, 2026 — Participant (see Experience for project details)

LANGUAGES

English (Fluent)

ADDITIONAL

Frontend Engineering Tutor Lead, NSBE — Mentored engineering students in modern web development practices within a global engineering organisation
